

MagicCode Streaming Software Data Reporting Notice

Document Version: v1.0.0. **Release Date:** September 19, 2026.

1. Purpose

This notice is a customer-facing summary of technical data reporting in MagicCode Streaming Software v1.0.0. Read it with the Privacy Policy. The Privacy Policy controls if there is any conflict.

Use it to fill your app privacy policy, Apple Privacy Nutrition Label, Google Play Data safety form, and (where applicable) a China SDK disclosure list.

2. Reporting in v1.0.0

The native SDK does **not** upload YUV, Annex-B, RTP, faces, or audio. The **standard** archive always sends a short technical telemetry packet over TCP (background thread, short-lived connection, XOR checksum), on the same pattern as MagicCode Super-Resolution.

Telemetry in the standard SDK is a **license condition**. It is used for **billing / license metering** and **issue diagnosis**, and also for SDK quality. There is no public API or environment variable to turn it off.

MagicCode may provide a **non-reporting archive under separate written authorization** (for example EU/UK products, child-directed products, or government tenders that require it). That archive is not the default SDK.

Item	v1.0.0 standard SDK
Image / video / YUV upload	No
Annex-B / RTP upload	No
Advertising ID (IDFA / GAID)	No
Device / local IP in the packet	No
Report time (client unix ms)	Yes
Device / app-instance UUID	Yes
Device model	Yes
SDK version	Yes
Average per-frame processing time (ms)	Yes
Average input bitstream size	Yes
Average output bitstream size	Yes
Error code	Yes
Report count	Yes
License-check ping (separate)	No

Triggers: session init (mc_streaming_enable first alloc), every 1024 mc_streaming_enable calls, and mc_streaming_disable. Video content is never included.

UUID is an app-instance identifier (Android ANDROID_ID or a locally stored ID; iOS identifierForVendor or a locally stored ID). It is not IDFA/GAID.

mc_streaming_get_version() returns the local string "1.0.0". Version lookup itself does not contact a server.

3. What may appear on the device only

- **Logs** if you set a log level: stderr or Android logcat (MagicStreaming). Not the telemetry channel.
- Failed report sends may log at info level.

4. Network requirement

Transcode still runs if the report server is unreachable (send is retried three times, then dropped). Offline devices can call mc_streaming_enable. Ordinary TCP server logs may show the connection's source address; that is not a payload field.

5. Integrator disclosure table

Copy or adapt this into your privacy materials and store forms. Values are for **this SDK only**.

Topic	What to declare
Data types	Device identifiers (app-instance UUID), device model, diagnostics (processing time, bitstream-size averages, error codes, SDK version, report time, report count)
Linked to user identity by this SDK	No (MagicCode does not receive your account)
Used for tracking / ads	No
Used for analytics	Yes (SDK quality)
Used for app functionality	Yes (billing / license metering, issue diagnosis)
Collected from children	Do not integrate the standard SDK into child-directed apps
Can the end user turn it off in the standard SDK	No
Optional / required	Required in the standard archive; a non-reporting archive exists only with written authorization from MagicCode

If you wrap the SDK in an application that has accounts, analytics, or crash reporting (Firebase, Sentry, your Token server, LiveKit, and similar), **you** must disclose that separately.

6. Future versions

If a later release changes fields or triggers, the Data Reporting Notice, Privacy Policy, and Release Notes will be updated.

7. Relationship to other documents

Document	Role
Privacy Policy	Controlling description of collection, purpose, retention, and rights
This notice	Implementation / store-disclosure summary
Third-Party Notices	Platform SDKs at build/link time, not telemetry
EULA	Contract; §5 describes technical telemetry as a license condition
